Factoring Review

Notes:

Case I/DOTS:

Factor each quadratic. If the quadratic is unable to be factored, your answer should be PRIME.

Examples:

$x^2 - 10x + 24$

Factors of 24, sum=10
 $(x - 6)(x - 4)$

$x^2 + x - 12$

Factors of 12, sum = -1
 $(x + 4)(x - 3)$

(D.O.T.S)

$x^2 - 49$

Diff of Two Sq.

$(x + 7)(x - 7)$

(D.O.T.S)

$4x^2 - 121$

Diff of Two Sq

$(2x+11)(2x-11)$

2Step:

Factor using the GCF and then try to factor what's left.

Example: $6x^2 - 18x + 12$ $20x^2 - 125$
 $6(x^2 - 3x + 2)$ $5(4x^2 - 25)$
 $6(x - 2)(x - 1)$ $5(2x + 5)(2x - 5)$

Grouping:

a ≠ 1

Examples:

$6x^2 - 5x - 4$ (mult. 1st by last) F= - 24, S= -5
 $6x^2 - 8x + 3x - 4$ Split the middle term
 $2x(3x - 4) + 1(3x - 4)$ Split and get GCF out of each side

$(3x - 4)(2x + 1)$ Take out the common binomial (3x-4)
as a GCF, that leaves 2x-1 as your 2nd binomial factor.
